

ABSTRACT OF THE DISCLOSURE

A system for dispensing flowable materials from a package. The system basically comprises the package and a receiver apparatus. The receiver apparatus includes a hollow interior chamber, e.g., a hopper, a penetrating assembly e.g., plural blades, fixedly mounted with respect to the chamber, and an outlet. The package, e.g., a flexible package, has a hollow interior in which the flowable material is located and includes at least one wall portion, e.g., a bottom wall, arranged to be penetrated by the penetrating assembly, whereupon the flowable material is enabled to flow out of the package for ultimate dispensing out of an outlet of the chamber.
